Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                 The present invention provides the protein and coding sequences for the variable regions of human monoclonal antibodies which are immunoreactive with human immunodeficiency virus-1 (HIV-1) envelope glycoprotein gpl20. These can be used in diagnosis and therapy of HIV-1 infection.
                                                                                                                                                                                                                                                                                                                                 CAAATGAACAGCCTGAGAGCCGAGGACACGGCCGTGTATTACTGTGCGAGAGGGATCT--

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a human antibody (hAb) against a fusion (poly)peptide or protein that includes a segment of at least 6 consecutive His residues. This antibody is useful in Western blots, enzyme-linked immunosorbent assay (ELISA), immunofluorescence or immunoprecipitation assays. Also hAb can be used for affinity purification of the protein, for in vivo diagnosis or therapy, and in production of vaccines. hAb are universally applicable alternatives to human serum. They are specific for the polyhistidine tag, regardless of the nature of the rest of the protein. Since hAb are not produced in an animmal, they contain no components that can induce an immune response in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          71.1%; Score 254.6; DB 20; Length 814; Pred. Lonberg N;

The present invention describes a method for detecting an analyte in a human sample containing human antibodies that specifically bind to antibodies from a nonhuman species. The method involves contacting the sample with a human antibody (1) which specifically binds to antibodies from a nonhuman species and detecting the binding between (1) and the analyte to indicate presence of the analyte. The method is used for detecting an analyte in a human sample containing human anti-mouse antibody (HAMA) (preferably human anti-mouse idotype antibodies and/or heterophilic antibodies). The method can also be used for detecting any type of target antibodies. The method can also be used for detecting any type of target antibodies or. The pertitis (A,B and C), influenza, Herpes, Glardia, Malaria, Leishmania, Staphylococcus aureus, Pseudomonas that cause human antibodies can be used as detection reagents for performing clinical diagnostic tests and for performing other in vitro detection assays, including for research purposes. (1) can be used in qualitative assays designed to indicate the presence of one or more target antigen in a sample that usually correspond to indicate the presence of one or more assays for each target antigen. Also, (1) is used to determine the sample that usually correspond to the sensitivity limitations of the sense. Quantification of one or more target antigens in a sample can also be carried out using (1). AAH41612 to AAH41686, and AAB99361 to the present in the exemplification of the present incidence. invention

Producing a human antibody phage display library comprises providing a transgenic animal whose genome comprises human immunoglobulin genes and isolating nucleic acids encoding antibody chains from lymphatic cells -

Example 22; Page 92; 161pp; English.

antibody phage display library (I), comprising: (1) providing a nonhuman transgenic animal (II) whose genome comprises human immunoglobulin genes; (2) isolating nucleic acids encoding human antibody chains (III) from lymphatic cells; and (3) forming a library of display packages whose members comprise a nucleic acid encoding (III) which is displayed from the package. The method is used for producing a human antibody display library, e.g., a Fab phage display library. The display method may be used to screen nucleic acids encoding antibody chains obstained from immunised nonhuman transgenic animals, and from this a population of antibodies may be prepared. Production of a human monoclonal antibodies sequences used in the exemplification of the present invention. display library using this method means there is no need to immunise humans with antigens, and the difficulties faced with immortalising B cells are avoided. AAH29958 to AAH30066 and AAB74994 to AAB75056 The present invention describes a method (M1) for producing a human represent
